

VMD423 / VMD423H

Three-phase voltage and frequency monitor for CHPs (Combined Heat and Power plants), wind power stations, hydroelectric power plants and photovoltaic systems in accordance with DIN V VDE V 0126-1-1

VMD423 / VMD423H

Three-phase voltage and frequency monitor for CHPs, wind power stations, hydroelectric power plants and photovoltaic systems in accordance with DIN V VDE V 0126-1-1

VMD423 / VMD423H

Device features

- VMD423 with separate supply voltage
- VMD423H is supplied by the system being monitored
- Undervoltage, overvoltage and under-frequency and overfrequency monitoring in 3(N)AC systems AC 0...500 V
- Monitoring of overvoltage by average determination of the latest 10-minute measuring interval
- Asymmetry, phase failure and phase sequence monitoring
- Start-up delay, response delay and delay on release
- Adjustable switching hysteresis
- r.m.s. value measurement (AC+DC)
- Digital measured value display via multi-functional LC display
- LEDs: Power On, Alarm 1, Alarm 2
- Measured value memory for operating value
- Cyclical self monitoring
- Internal test/reset button
- Two separate alarm relays (one changeover contact each)
- N/C or N/O operation and fault memory behaviour selectable
- Password protection for device settings
- Sealable transparent cover
- Push-wire terminal (two terminals per connection)
- Two-module enclosure (36 mm)
- RoHS compliant

Product description

According to DIN V VDE V 0126-1-1, the voltage and frequency shall be monitored when feeding power into the public low voltage grid from private electricity generation systems > 30 kW (such as CHPs, wind power stations, hydroelectric power plants and photovoltaic systems).

The three-phase VMD423 series voltage and frequency monitors monitor the voltage and frequency at the feeding point of the public grid. At the feeding point of the medium voltage grid, the output voltages and frequencies are measured by means of voltage transformers (100 V). An alarm relay is activated within ≤ 80 ms when limit values are reached (response values according to VDEW guideline "Private electricity generation systems at the medium voltage grid"). An overvoltage ($> U_2$), measured as average value over a 10-minute period, will cause the alarm relay to switch.

The voltages are measured as r.m.s. values. In addition asymmetry, phase failure and phase sequence are monitored.

The VMD423 is suitable for multifunctional monitoring tasks and can be adapted to the requirements of the electricity supply companies.

The currently measured values are continuously shown on the LC display. The measured value causing the alarm relay to switch is saved. Due to adjustable start-up delay and delay on release, the network operator's specific requirements can be considered such as device-specific start-up procedures, short-time voltage fluctuations etc.

The VMD423 series requires a separate supply voltage, whereas the VMD423H version draws its supplies from the system.

Typical applications

- Monitoring of automatic switching points between private electricity generation power system in parallel operation with the public low voltage grid.
- Applications according to DIN V VDE V 0126-1-1 (VDE V 0126-1-1): 2006-02
- Applications according to VDEW guideline DIN V VDE V 0126-1-1: 2006-02
- Universally applicable for photovoltaic systems > 30 kW, CHPs (Combined Heat and Power plants), wind power stations and hydroelectric power plants

Function

Once the supply voltage is applied, the start-up delay "t" begins. Measured voltage and frequency values being changed during this start-up period t do not influence the alarm LEDs and the state of the alarm relays.

The devices utilise several separately adjustable measuring channels (overvoltage/undervoltage, overfrequency/underfrequency). When the measured value exceeds or falls below the response value, the time of the response delays "t_{on 1/2}" begins. Once the response delay has elapsed, the alarm relays switch and the alarm LEDs light up. If the measuring value exceeds or falls below the release value (response value plus hysteresis) after the alarm relays have switched, the selected delay on release "t_{off}" starts. Once "t_{off}" has elapsed, the alarm relays switch back to their initial position. When the fault memory is activated, the alarm relays remain in alarm state until the reset button R is pressed. On voltage recovery, the alarm message remains active until the set start-up delay "t" has elapsed.

Operating elements

- 1 - Power On LED "ON" (green): Lights up when voltage is available and when the device is in operation or flashes in case of system fault alarm.
- 2 - Alarm LED "AL1" (yellow): Lights up in case of the following fault messages: > U1 / > U2 (10 minute average determination).
- 3 - Alarm LED "AL2" (yellow): Lights up in case of the following fault messages: < U.
Both the alarm LEDs "AL1" and "AL2" light up in case of the following fault messages: < f / > f / Asy / PHS, the alarm LEDs flash in case of system fault alarm.
- 4 - Display: Displays information on operation.
- 5 - UP key (< 1.5 s) / TEST (> 1.5 s):
The UP key is used to increase input values or to navigate through the menu.
The test button "T" is used to start a manual self test.
- 6 - Down key (< 1.5 s) / RESET (> 1.5 s):
The Down key is used to decrease input values or to navigate through the menu.
The reset button "R" is used to activate a manual reset.
- 7 - Enter key (< 1.5 s) / MENU (> 1.5 s):
The Enter key is used to save input data and changed data.
Press the MENU key to call up the menu system.
Press the ESC key > 1.5 s in the menu mode:
to abort an action or to return to the previous menu level. (ESC)

When the menu item LEd is activated, the alarm LED AL1 indicates that K1 is in the alarm state. When AL2 lights up, K2 is in the alarm state.
